1.0 Summary

WorleyParsons prepared three estimates for the NYSEG Compressed Air Energy Storage (CAES) project, two estimates based on Cycle 1 technology (Dresser-Rand) and one estimate based on Cycle 2 technology (ES&P / Man Diesel Turbo).

Initially, WorleyParsons' objective was to prepare two "bottom-up", +/-10% estimates, one for Cycle 1 and one for Cycle 2. Late in the project, it was determined that Cycle 1 could be more viable if output were increased. This resulted in the establishment of Cycle 1A. However, the timing did not allow for the development of the design to support a +/-10% estimate. Rather, the 1A estimate was developed by factoring from the Cycle 1 estimate. The below table summarizes the three estimates prepared by WorleyParsons.

Cycle	Compression	Output	Accuracy	Estimate	Estimated Cost	Estimated Cost
	(MW)	(MW)	-	Approach	(\$ Millions)	(\$/kW)
1	170	135	+/- 10%	Bottom Up	\$337.8*	\$2,502
1A	170	210	+/- 20%	Factored	\$364.6*	\$1,736
2	170	210	+/- 10%	Bottom Up	\$380.0*	\$1,810

^{*} Excludes Cavern development costs, Owner's costs, Permit development costs and AFUDC

2.0 Estimate Scope

The scope of each estimate includes the following:

- All scope inside the plant boundary limits
- Offsite water intake structure and pipeline to plant
- Plant switchyard
- 115kV transmission line to interconnect point
- Interconnect switchyard
- 34.5kV distribution line to raw water intake.

3.0 Quantity Development (Cycles 1 & 2 only)

Equipment quantities for major equipment components are based on the plant layout and configuration and associated equipment list and P&ID's. Balance of plant equipment quantities are based on plant designs of similar size developed by WorleyParsons engineering.

Bulk material takeoffs were developed as follows.

Civil

Material take-offs were performed for the bulk civil items such as: stormwater control, fencing, plant roads, access roads, cut & fill, seeding & mulching and excavation.

Structural – Foundations

Concrete quantities for major and minor foundations were developed using inhouse information for similarly sized equipment and structures where available. In cases where in-house information was not available, conceptual designs were developed for the purpose of bulk material quantification. Concrete quantities include foundations for all equipment and buildings.

Structural – Steel

Structural steel quantities were developed based on the preliminary design of the buildings and structures.

Piping

Process and Instrumentation Diagrams (P&ID's) were developed for several systems. Using the P&ID's, pipe quantities were developed by establishing a conceptual routing of the piping on the site plan. This was done for all of the major systems and several of the secondary systems.

Valves

In conjunction with in-house piping specifications, the P&ID's were used to establish the basis of the valve quantities.

Electrical – Ductbank

Ductbank quantities were developed using a conceptual ductbank layout.

Electrical – Cable Tray

Cable tray quantities were developed based on a conceptual cable tray layout.

Electrical Cable (Power, control)

Power and control cable quantities were developed using the conceptual layouts for cable tray and ductbank. Efforts were made to identify all of the power circuits required and to establish lengths for each of the various cable sizes.

Electrical Cable (Site Grounding)

A conceptual grounding grid was developed for the purpose of establishing quantities.

Insulation

Pipe insulation quantities were developed based on heat conservation and personnel protection requirements of the various piping systems. Equipment insulation quantities were developed based on conceptual equipment sizes and configurations.

A material take-off/design development allowance to account for quantity growth through the design process is included at the summary level of the estimate. (See Section 7.1 for an expanded discussion.)

4.0 Equipment Pricing

Vendor quotes were solicited from suppliers of the following equipment. Except as noted, the quotes are furnish-only. All quotes are based on "overnight" pricing. WorleyParsons adjusted the quotes to include items such as Technical Direction during Installation (TDI), freight and start-up spares, in cases where vendors omitted these costs.

- Process Air Compressors
- Combustion Turbine Generator
- Air Expanders
- Recuperator
- Cooling Tower (Furnish & Erect)
- Circulating Water Pumps
- Aux Cooling Water Pumps
- Vertical Pumps
- Emergency Generator
- Continuous Emissions Monitoring System (CEMS)
- Bridge Crane
- Fuel Gas Compressors
- Water Treatment System
- Generator Step Up Transformer
- Auxiliary Transformer
- DCS System
- Fire Protection Pumps
- Field Erected Storage Tanks (Furnish & Erect)

The total value of the above equipment as a percentage of Plant Capital Cost is tabulated below.

Quoted Equipment as a Percentage of Plant Capital Cost					
Cycle 1	Cycle 1A	Cycle 2			
42%	41%	35%			

Pricing for equipment where vendor quotes were not received is based on recent pricing for similar equipment from WorleyParsons estimating in-house data, adjusted to 4Q2011 dollars. WorleyParsons is able to draw from an extensive collection of pricing for a wide array of equipment and materials. This collection was generated and developed through many years of executing the design, procurement and construction management of various power-related projects.

5.0 Bulk Material Pricing

Bulk material pricing is applied to quantities developed for the project. In general, pricing is based on WorleyParsons in-house data. However vendor input was received for the following bulk commodities:

- Ready-mix concrete
- Reinforcing Steel
- Roofing
- Siding
- Select piping & valves

6.0 Construction Labor

Development of overall construction labor costs takes into account wage rates, installation hours, labor productivity, labor availability and construction indirect costs. A more detailed description and methodology is as follows.

6.1 Wage Rates / Construction Crews

Davis-Bacon prevailing rates were obtained from the GPO Access website for Davis-Bacon Wage Determination. Appendix A is a listing of Journeyman wage rates and fringe benefit rates used in the estimate. Rates are valid to May, 2012.

In calculating the average wage rate for any given craft, WorleyParsons assumes a ratio of 1 apprentice to 8 journeymen to 1 working foreman. It should be noted that there may be a requirement for a greater number of apprentices. The approach taken by WorleyParsons allows for a higher ratio of apprentices to journeymen without exceeding estimated costs. With respect to General Foreman, requirements vary among the construction trades. For trades that use General Foreman, WorleyParsons includes 1 General Foreman for every 35 craft.

WorleyParsons developed several construction crews that incorporate not only the above wage rates for the respective crafts, but also construction indirects (as more fully described in Section 6.5) specific to the respective crew. Below is a listing the crews used in the development of the estimate.

- Site Work-Light
- Site Work-Medium
- Site Work-Heavy
- Site Work-Extra Heavy
- Underground Electrical
- Electrical Bulks
- Electrical Equipment
- Insulation
- Instrumentation/Controls
- Mech. Equipment-General
- Combustion Turbine Erection
- Boiler Erection
- Expander Erection
- HVAC
- Underground Piping
- Above Ground Piping
- Fire Protection
- Plumbing
- Painting

- resources & energy
 - Concrete-Forms
 - Concrete-Rebar
 - Concrete-Placement & Finish
 - Concrete-Complete
 - Masonry
 - Structural Steel
 - Miscellaneous Steel
 - Carpentry
 - Roofing
 - Siding
 - General Architectural

6.2 Installation Hours

WorleyParsons maintains a database of standard unit installation hours. The database represents standard installation rates for US Gulf Coast Merit Shop. Standard unit installation rates were applied to the quantities and equipment in the estimate. The resultant hours were further adjusted for local productivity (described below).

Equipment setting man-hours were developed using a combination of several techniques. Installation was developed using equipment weights, equipment size, and fabrication completeness upon delivery. Bulk material man-hours are based on WorleyParsons data base.

6.3 Labor Productivity

The estimate reflects union productivity for the Schuyler County, NY area. In evaluating productivity, factors such as jobsite location, type of work (i.e.: new construction) and site congestion were considered. The average productivity factor included in the estimate is a 1.1 multiplier over US Gulf Coast Merit Shop, as described in Section 6.2 above. The increase in hours (or the decrease in productivity) is driven by the jurisdictional guidelines set forth in the union work rules, as opposed to individual craftsperson capabilities.

6.4 Labor Availability

Labor is based on a 50-hour work-week (5-10s). No additional incentives such as bonuses have been included to attract craft labor. The estimate is based on an adequate supply of qualified craft personnel being available to staff this project. It is estimated that about half of the craft required for the project will come from Rochester, NY, with the balance from either Elmira or Ithaca. The estimate includes a travel allowance of \$80/day for half of the craft.

6.5 Construction Indirects

In addition to base wage rates and fringe benefits, labor costs include construction indirect costs. A listing of construction indirect costs and a brief description of each is as follows.

Category	Description
Payroll taxes and insurances	Includes employer portions of the following:
ayron taxoo ana modranoco	Worker's Compensation Insurance
	FICA
	Federal Unemployment Insurance
	State Unemployment Insurance
Contractor's General Liability	Covers the premiums anticipated to be
insurance	incurred
Construction Supervision	Contractor's Supervision including:
Construction Supervision	Contractor's Site Management
	Superintendents
	Project Controls
	Site Administrators
	Site Quality Assurance
	Inspectors
	Site Clerical
	Miscellaneous Supervision
Indirect Craft Labor	Non-Direct Craft Labor Items including:
mandet Grant Eabor	Tool Control
	Training
	Welder Certification
	Fire Watch
	Site Cleanup
	Dust Control
	Miscellaneous Indirect Work
Scaffold Erection	Includes costs for rental, erection & removal
Coanora Erocuen	of scaffolding.
Temporary Facilities	Includes any temporary structures (other than
, ,	field office) or utilities required at the job site.
	Items include (but are not necessarily limited
	to):
	 Temporary Warehouse
	Site Security
	Temporary Electric grid
	 Power consumed during construction
	 Water consumed during construction
	 Trash Hauling fees
	 Temporary sanitary connections
	 Temporary Sanitary Facilities
	Change trailers
Field Office	Field Office Trailer costs including:
	Trailer rental
	Furniture
	Office equipment
	Computers
	Site communication
<u> </u>	Office supplies
Small Tools & Consumables	Small tools required for construction.

	Consumables such as welding gases and rods
Material Handling	Labor costs to receive, unload & properly store materials and equipment delivered to the site. Includes materials management. Labor to retrieve materials and equipment from storage and deliver to the worksite.
Safety / Incentives	Includes safety manager, personal protective equipment, drug testing kits including lab fees, jobsite orientation materials and materials required to maintain a safe jobsite.
Mobilization / Demobilization	Includes costs associated with mobilizing to the jobsite and demobilizing from the jobsite
Construction Equipment	Includes costs for rental of all construction equipment necessary to construct the project. Equipment operators are included with direct labor costs.
Fuel, Oil & Maintenance for Construction equipment	Includes costs for the fuel, oil & maintenance of the construction equipment above.
Contractor's Overhead and Profit (on labor and indirects)	Contractor's overhead and profit markup on all labor-related items as included above. (Contractor's markup on materials discussed in Section 7.2 below)

Appendix B presents a breakdown of the overall average composite wage rate used in the estimate.

7.0 Other Costs and Exclusions

7.1 Material Take-Off and Design Allowance

Material Take-off (MTO) and Design Allowances are included in the estimate and are intended to compensate for the degree of engineering that is incomplete. This allowance differs from contingency since it is a known "unknown", as opposed to contingency which is considered an assessment of unknown "unknowns".

The value for MTO and Design allowance was established by applying percentages to estimated costs for major bulk commodities. Percentages ranging between 5% and 10% were used. Percentages are based on a number of factors including historic percentage changes, degree of certitude in design features and overall confidence in developing quantities for the respective system. Based on WorleyParsons experience in combined cycle power plants, the following percentages were used:

Description	MTO %
Site Preparation	5
Concrete Work	5
Pipe, Valves & Fittings – Above Ground	6

Structural Steel	5
Instruments & Controls	5
Painting	10
Electrical	5
Insulation	6
Site Development, Roads & Paving	5
Buildings	5
Building Components & Fixtures	5
Pipe, Valves & Fittings – Below Ground	6

7.2 Contractor Markup on Materials

Contractor markup on materials reflects the markup that contractors will apply to materials provided under their respective contracts. A rate of 6% was used, based on WorleyParsons experience with current market conditions. This markup represents contractor's overhead & profit on materials purchased by the contractor. (Note that contractor's overhead & profit on labor and construction indirects is included in the composite labor rate). As more fully described in Sections 8.1 and 8.2 below, many items will be purchased via separate purchase orders by the EPCM contractor and delivered to the site for installation by the construction subcontractor. In keeping with the EPCM concept, no contractor's markup was applied to materials to be purchased under these purchase orders.

7.3 Professional Services

Costs for Engineering and Design, Construction Management, Start-up Services and home office support during construction and startup have been included as an allowance based on typical costs for similar projects. The specific services provided are as follows:

Engineering and Design

Engineering and Design includes all of the engineering, design, procurement and management required for the project. Tasks include but are not necessarily limited to:

- All Civil, Structural, Architectural, Mechanical, Piping, Electrical, Instrumentation and Controls Engineering.
- All Civil, Structural, Architectural, Mechanical, Piping, Electrical, Instrumentation and Controls Layout and Design work
- · Specification of equipment and services.
- Development of contract documents for Purchase Orders and Construction Contracts
- Issuing Requests for Quotations (RFQ) and Requests for Proposals (RFP) for all Purchase Orders and Construction Contracts.
- Receiving all RFQs and RFPs, performing bid evaluations, participation in negotiations, and issuing Purchase Orders and Constructions Contracts.
- Serving as an agent for RGE in the Administration of the Purchase Orders and Construction Contracts.

- Providing home office engineering support during construction and commissioning.
- Providing overall design and project management including scheduling, estimating, project controls, document controls, general administration and clerical support.

Construction Management

Construction Management includes pre-construction support of engineering & procurement, and site construction management during construction. It is anticipated that the following personnel will be required to provide proper oversight of the construction contracts:

- Site Construction Manager
- Contracts Administration Specialist
- Quality Coordinator
- Safety Lead
- Warehouse Specialist
- Structural Discipline Lead
- Mechanical Discipline Lead
- Rotating Equipment Specialist
- Electrical Discipline Lead
- Instrumentation Discipline Lead
- Project Controls / Scheduling Lead
- Cost Analyst
- Administrative Assistant
- Document Control Clerk

Start-Up Services

Start-Up Services include the development and implementation of the procedures and testing in order to energize plant systems and turnover a fully operational facility to the owner.

7.4 Escalation to Period of Performance

The estimate includes escalation to the period of performance. There are two major steps in developing estimated costs for escalation – development of annual escalation percentages and application of annual escalation percentages.

Development of Annual Escalation Percentages

For annual escalation percentages, WorleyParsons sought input from Cambridge Energy Research associates (CERA). CERA is an independent research company serving the energy industry. For future escalation, CERA employs three different approaches. Below is a listing of the framework scenarios and a brief summary of each.

- Global Redesign "Reinvigorated market forces and shared interest among major powers to expand trade and investment foster robust economic growth"
- Metamorphosis "Describes an accelerated move toward a lower-carbon energy economy
- Vortex "Volatile economic growth returns with a vengeance in the early 2010's"

For this project, CERA provided future projected escalation rates for various categories for both Global Redesign and Vortex framework scenarios. Since Global Redesign is considered the "most-likely" scenario, they were chosen as the basis for the escalation percentages.

Projected annual escalation percentages used are shown in Appendix C.

Application of Annual Escalation Percentages

The annual escalation percentages were overlaid against the project schedule in order to develop values for escalation. More specifically, estimated items were divided into three major categories: equipment, bulk material and labor. The approach to each is more fully described below.

Equipment

Equipment was divided into Procurement Packages (See Section 8.1 for discussion regarding Procurement Packages) categories such as pumps, electrical equipment, tanks, etc. The project schedule was then used to determine the approximate date when a purchase order will be issued and when delivery of the goods under the purchase order will be made. The midpoint between these two dates is considered the date to which the respective category needs to be escalated. The escalation duration is the amount of time between the data date, which is November 2011 for all equipment, and the above midpoint. The annual escalation rates are applied to the escalation duration to determine the value for escalation.

Bulk Material

Bulk materials were divided into construction packages (See Section 8.2 for discussion regarding Construction Packages). The project schedule was then used to determine the approximate date when a construction contract will be issued and when installation will occur, recognizing that installation in many cases will occur over several months. The mid-point between these two dates is considered the date to which the respective category needs to be escalated. The escalation duration is the amount of time between the data date, which is November 2011 for all materials, and the above midpoint. The annual escalation rates are applied to the escalation duration to determine the value for escalation.

Labor

For labor, the Construction Package breakdown was used. Similar to both equipment and bulk materials, each category was compared against the schedule to establish a timeframe for expenditures. Labor escalation tends to be different from the escalation for equipment and bulk materials in that pay increases tend to occur once per year, generally around May or June. In order to determine the value of escalation, the following process was used for each category: Beginning with 2012, the schedule was evaluated to determine what percentage of the work would occur after each annual uplift. This percentage was then multiplied against the estimated value of labor for a given category. The resultant was then multiplied against the annual escalation percentage for the same year. This revised value becomes the starting point for determining the subsequent years' escalation. This process is repeated for all subsequent years requiring escalation.

Estimated escalation values for the above categories are summarized in Appendix L.

7.5 Project General Contingency

General contingency addresses unspecified elements of cost within the current defined project scope. It is expected that by the end of the project the entire contingency will be spent on either direct or indirect costs.

Project contingency is calculated by applying a range of factors to individual systems or components within the estimate. Contingency rates ranging from 3% to 24% were applied, depending on the likelihood for cost changes. In establishing percentages for contingency, the estimate was divided into four major categories: Equipment, Bulk Materials, Installation Labor and Professional Services

Key considerations for contingency by category are as follows:

Equipment:

- A large percentage of estimated equipment costs is based on either vendor quotes or recent in-house data, contributing significantly to pricing confidence.
- In WorleyParsons experience, equipment pricing tends to experience only minimal growth over a project's duration.

Bulk Materials:

- The design as estimated is subject to quantity growth. While MTO and design allowances are included to cover 'normal' quantity growth, it is conceivable that a greater than expected amount of growth could occur.
- Occasionally in the detailed design phase, the specification of a given item will be enhanced and, thus, more expensive.

• In WorleyParsons experience, the design team has a certain amount of control over issues such as quantity growth.

Installation Labor:

- Labor costs tend to be the most subjective costs within the estimate.
 Actual productivity can vary significantly from estimated productivity. Even a 5% reduction in productivity could translate into several million dollars.
- Depending on locally available resources, it could be necessary to go beyond the immediate area to staff the project. If so, incentives beyond overtime could be necessary.
- In WorleyParsons experience, the area that experiences the most growth is installation labor.

Professional Services:

For Professional Services, a flat percentage of 10% was used. This percentage is based on WorleyParsons experience in designing, procuring and managing the construction of power plants.

Overall Average

The overall average contingency equates to 7.9%. The table below shows the range of contingency percentages applied to the various cost categories.

Project General Contingency						
Item	Cycle 1A	Cycle 2				
Equipment	3 – 6	3.1	4.2	3.2		
Bulk Material	10 – 18	13.4	14.7	13.7		
Installation Labor	20 - 24	20.0	21.8	20		
Professional Services	10	10.0	10	10		
Total		9.5%	10.9%	10.3%		

7.6 Project Specific Contingency

Specific contingency addresses specific cost items likely to be incurred but having unknown value. As indicated above, vendor quotes were solicited for key CAES equipment. The solicitation packages included specific commercial terms & conditions (T's & C's). The vendor quotes received did not take into account the requirements of the T's & C's. In order to account for this disparity and, not knowing the exact amount needed by the vendors to conform to the T's & C's, a specific contingency was included. This applies to Cycles 1, 1A & 2. The value of the specific contingency was established by taking 6% of the value of the key CAES equipment.

Additionally, Cycle 2 vendors require a License Fee. Although the value of the License Fee was provided by the vendor, it was decided to include this value as a specific contingency.

7.7 Other Exclusions

A list of items excluded from the estimate includes, but is not necessarily limited to, the following:

- Owner's Costs (see below)
- Premiums beyond 5-10's required to attract craft labor
- Premiums associated with an EPC contracting approach
- Allowance for Funds Used During Construction
- All taxes with the exception of payroll taxes
- Cavern Development Costs

7.8 Typical Owner's Costs

Owner's costs are excluded from the estimate. Typical Owner's costs include, but are not limited to, the following:

- Permits & Licensing
- Land Acquisition / Rights of Way Costs
- Project Development Costs
- Legal Fees
- Owner's Engineering / Project & Construction Management Staff
- Plant Operators during startup
- Electricity consumed during startup
- Fuel and Reagent consumed during startup
- Initial Fuel & Reagent Inventory
- Transmission Interconnections & Upgrades
- Operating Spare Parts
- Furnishings for new Office, Warehouse and Laboratory
- Financing Costs

8.0 Engineering, Procurement & Construction Management Approach

The estimates are based on an Engineer – Procure – Construction Manage (EPCM) multiple contract approach. This approach basically has one main contractor, typically an A/E firm to produce the design, assist in the procurement of goods and services and provide construction management services during construction. The EPCM contractor generally acts as an agent for the owner when purchasing said goods and services, meaning contracts and purchase orders are written on the owner's letterhead.

There may be several purchase orders to purchase the necessary engineered equipment and engineered bulks for the project. These items would be handed to the installation contractors to install. The estimate is based on no markups by the EPCM contractor on any of the purchase orders or construction contracts.

Installation is achieved through the use of multiple subcontractors. Contractors are responsible for purchasing non-engineered bulks such as concrete and small bore

piping. As discussed in Section 7.2, Contractors will generally apply a markup on the value of non-engineered bulks for overhead and profit.

The estimate is based on warranties being provided by the equipment manufacturers. Additionally, the EPCM contract does not include plant performance guarantees, pricing guarantees, schedule guarantees or guarantees associated with consumables during plant operation (fuel, aux power, etc).

8.1 Procurement Approach

As discussed above, the execution of the EPCM contracting approach will involve multiple purchase orders. Below is a sample listing of Furnish-only Purchase Orders. Because of the flexible nature of the EPCM contracting approach, this list can vary significantly.

Furnish & Deliver Purchase Orders				
Air Turbine Generator	Fuel Gas Compressor			
Combustion Turbine Generator	Fuel Gas Conditioning			
Emergency Generator	Fuel Gas Chromatograph			
Large Circuit Breakers	Bridge Crane			
Isophase Bus Duct	Circulating Water Pumps			
Non-Segregated Phase Bus Duct	Sump Pumps			
Raw Water Pumphouse MCC	Fire Water Pumps			
Step-Up Transformers	Misc Horizontal Pumps			
Aux Transformers	Misc Vertical Pumps			
Miscellaneous Transformers	Recuperator			
Distributed Control System	Process Air Compressors			
Continuous Emissions Monitoring	Air Receiver & Dryer			
Ammonia Handling System	Air Stack			
Water Treatment System	Circulating Water Piping			
Oil / Water Separator	Power Distribution Centers			
Packaged Sanitary System				

8.2 Contracting Approach

As discussed above, the execution of the EPCM contracting approach will involve multiple construction contract packages. Below is a sample listing of Furnish, Deliver & Erect Contracts. Similar to the procurement packages, the flexible nature of the EPCM contracting approach allows for this list to vary significantly.

Furnish, Deliver & Erect Contracts				
Cooling Tower	Mechanical Erection			
Field Fabricated Tanks	Piping			
Initial Sitework	Fire Protection			
Final Sitework	Insulation			
Offsite Pipeline	Plant Switchyard			
Foundations & Underground Utilities	Interconnect Switchyard			
Generation Building Erection	115kV Transmission Line			
Admin / Maintenance Building Erection	34.5kV Distribution Line			
Pre-Engineered Buildings	Electrical and I&C			
Raw Water Pumphouse	Start-Up Subcontracts			

9.0 Estimate Results

Below are the results of the capital cost estimates for the three CAES cycles.

Plant Capital Costs

10.0 Comparison Estimates

The CAES technology is somewhat unique. As a means of comparing the CAES plants to the costs of more mainstream technology, two high-level estimates were developed; one for natural gas-fired simple cycle and one for natural gas-fired combined cycle. The configurations and associated output are below:

Comparison Estimate Configurations			
	Configuration	Output (MW)	
Simple Cycle	4 x 0 LM6000PG	210	
Combined Cycle	3 x 1 LM6000PG	209	

The estimates were developed using WorleyParsons in-house parametric estimating model. The model uses high-level project parameters to generate conceptual-level cost estimates. The model has the capability to incorporate vendor information for major equipment. WorleyParsons has a significant amount of recent vendor information for the equipment required for the comparison estimates. This information was incorporated into the estimates.

The comparison estimates have an accuracy of +/-30%. The overall scope of the comparison estimates is similar to that of the CAES estimates and includes:

- All scope inside the plant boundary limits
- Offsite water intake structure and pipeline to plant
- Plant switchyard
- 115kV transmission line to interconnect point
- Interconnect switchyard
- 34.5kV distribution line to raw water intake.

Results of the comparison estimates are below:

Comparison Estimates			
Item	Simple Cycle	Combined Cycle

Seneca CAES Project - Cost Estimating

<u>Cost Estimate</u> <u>Total Project Estimate Overview</u>

Plant Capital Cost Estimate Overview

- Plant Capital Cost Estimates were developed for the following cases:
 - Cycle 1 (170MW / 135MW Compression/Generation)
 - Cycle 1A (170MW / 210MW)
 - Cycle 2 (170MW / 210MW)
- Estimate Approach & Accuracy:
 - Cycle 1: Detailed, Bottom-Up, +/-10%
 - Cycle 1A: Factored from Cycle 1, +/- 20% (see separate slide for explanation)
 - Cycle 2: Detailed, Bottom-Up, +/- 10%
- Estimate Scope includes:
 - All scope within the plant boundary
 - Switchyard, transmission line and interconnect substation
 - Raw water pump house and pipeline to plant

Plant Capital Cost Estimate Scope Development

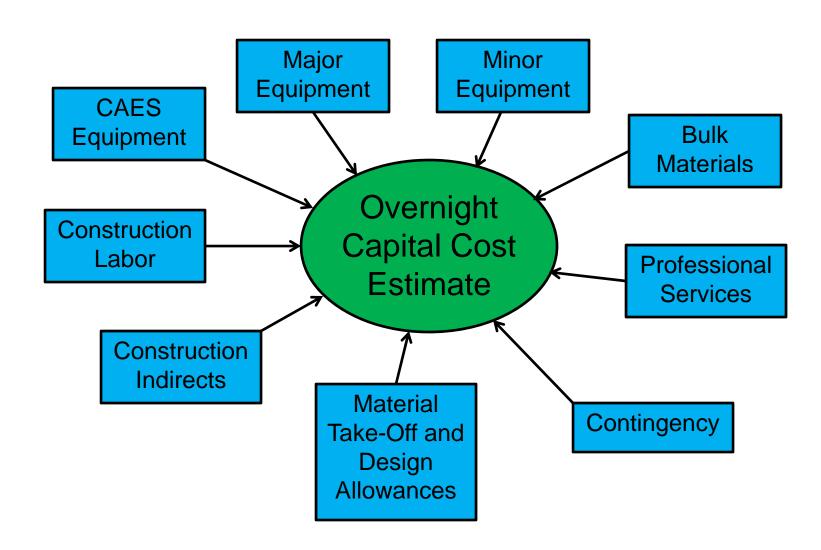

Cycle 1 & Cycle 2

- Scope of project defined through the engineering process:
 - Layouts, P&ID's Equipment Lists, Single Line Diagrams, etc.
- Material Take-Offs developed for bulk materials including: (but not limited to)
 - Excavation
 - Concrete
 - Reinforcing Steel
 - Structural Steel
 - Siding
 - Roofing
 - Pipe
 - Valves
 - Cable
 - Conduit
 - Cable Tray

Plant Capital Cost Estimate Components

Plant Capital Cost Estimate Equipment Pricing

CAES Equipment Vendor pricing received for the following CAES

Equipment:

Air Compressors Air Expanders
Combustion Turbine Recuperator

Major Equipment Vendor pricing received for the following Major

equipment:

Bridge Crane Cooling Tower

Field Erected Tanks
Vertical Pumps
GSU Transformer
CEMS
Circ Water Pumps
Fire Protection Skid
Emergency Generator
Fuel Gas Compressor

Minor Equipment Includes minor, Balance-of-Plant equipment such as

sump pumps and small transformers. Pricing

developed based on WorleyParsons in-house cost

data.

Plant Capital Cost Estimate Bulk Material Pricing

Bulk Materials

Vendor pricing received for the following bulk materials:

Aggregate Ready-Mix Concrete

Reinforcing Steel Siding (Insulated & Uninsulated)

Roofing Noise Enclosures

ARC Valves U/G Valves

FRP Piping Ductile Iron Piping

Control Valves

The balance of bulk material pricing is based on WorleyParsons – in-house cost data.

Plant Capital Cost Estimate Construction Labor

Wage Rate Davis Bacon rates for Schuyler County, NY

Crew Rates WorleyParsons standard crew configurations used. Crews

consist of a blend of crafts required for a specific task as

well as the construction supervision and construction

indirects needed to perform the task.

Installation Hours Hours to install permanent plant equipment developed

based on equipment type, weight, size and fabrication

completeness upon delivery. Hours to install bulk materials

based on WorleyParsons in-house installation data.

Labor Productivity Labor Productivity based on published information for the

Watkins Glen, NY area.

Work Week Estimate based on working 5 days per week, 10 hours per

day. An allowance for casual overtime is included.

Travel The estimate is based on 50% of the craft receiving

\$80/day per diem allowance.

Plant Capital Cost Estimate Construction Indirects

Construction Indirects include the following:

- Payroll Taxes & Insurance
- Contractor's General Liability Insurance
- Construction Supervision
- Indirect Craft Labor
- Scaffold Erection
- Temporary Facilities
- Field Office
- Small Tools & Consumables
- Material Handling
- Safety / Incentives
- Mobilization / Demobilization
- Construction Equipment
- Fuel Oil & Maintenance
- Contractor's Overhead & Profit

Plant Capital Cost Estimate Procurement Packages

The estimates are based on the following Procurement Packages:

Air Turbine Generator

Combustion Turbine

Emergency Generator

Large Circuit Breakers

Iso-phase Bus Duct

Non-Seg Bus Duct

Raw Water Pumphouse MCC

Step-Up Transformer

Aux Transformers

Miscellaneous Transformers

DCS

CEMS

Ammonia Unloading & Forwarding

Water Treatment

Oil / Water Separator

Packaged Sanitary System

Fuel Gas Compressor

Fuel Gas Conditioning

Fuel Gas Chromatograph

Bridge Crane

Circ. Water Pumps

Sump Pumps

Fire Water Pumps

Misc .Horizontal Pumps

Misc. Vertical Pumps

Recuperator

Process Air Compressor

Air Receiver & Dryer

Air Stack

Circ. Water Pipe

Power Distribution Centers

Plant Capital Cost Estimate Construction Packages

The estimates are separated into the following Construction Packages:

Cooling Tower Mechanical Erection

Field Fabricated Tanks Piping

Initial Sitework Fire Protection
Final Sitework Insulation

Offsite Pipeline Plant Switchyard

Foundations & U/G Utilities Interconnect Switchyard
Generation Building Erection 115kV Transmission Line
Admin/Maint. & Mech Eq. Bldg. 34.5kV Distribution Line

Pre-Engineered Buildings Electrical and I&C

Raw Water Pumphouse Start-up Subcontracts

Plant Capital Cost Estimate Cycle 1A Approach

Cycle 1A Estimate approach is different from that of Cycle 1 and Cycle 2.

Late in the process, Dresser-Rand provided pricing for Air Expanders capable of generating 210MW (Cycle 1 is 135MW). WorleyParsons had insufficient time to develop a detailed design and associated estimate for this case, labeled Cycle 1A.

Rather, WorleyParsons developed a 'factored" estimate as follows.

- Starting point is Cycle 1
- Each Procurement Package and Construction Package was broken down into logical buckets. For instance, The Foundations and U/G Utilities contract was broken down by foundation. Mechanical Erection was broken into equipment type.
- Factors were applied where appropriate. For instance, the GSU transformer foundation was multiplied by a factor based on plant output.
- Revised Dresser-Rand Pricing was used directly

Plant Capital Cost Estimate MTO & Design Allowances

Material Take-Off and Design Allowances

- Considered a "known unknown", which differentiates this allowance from contingency
- Intended to compensate for the degree of engineering that is incomplete at the time of estimate preparation.
- Calculated by applying percentages to the estimated costs for major bulk commodities
- Percentages based on a number of factors including:
 - Historic percentage changes
 - Degree of certainty in design features
 - Overall confidence in developing quantities for respective systems.

Plant Capital Cost Estimate Professional Services

Professional Services includes:

- Engineering
- Design
- Procurement Services
- Project Management
- Site Construction Management
- Plant Startup Services

Plant Capital Cost Estimate Escalation

- Escalation is intended to capture predicted changes in costs between Estimate Development and Project Execution
- Escalation development involves two major steps:
 - Development of Annual Escalation percentages
 - Application of Annual Escalation percentages
- Forecasted percentages provided by CERA
- Project schedule used to determine the length of time between overnight cost estimate data date and mid-point of scheduled expenditure.
- Escalated values determined by multiplying overnight costs against annual escalation percentages for the required duration as determined above, compounded annually.
- Escalation averaged slightly over 2% per annum.

Plant Capital Cost Estimate General Contingency

- Addresses unforeseen elements of cost within the defined scope
- Calculated by applying a range of factors to individual systems or components
- Major Categories and the respective range of percentages for contingency are as follows.:

 Permanent Plant Equipment 	3.0 - 6.0%
 Permanent Plant Equipment 	3.0 - 6.0%

Overall average contingency percentage ranges from 9.5 – 10.4%

Plant Capital Cost Estimate Specific Contingency

- Addresses foreseen elements of cost that have undefined value.
- Specific Contingencies included for the following:
 - Commercial Terms & Conditions on CAES Equipment
 - Licensing Fee (Cycle 2 only)

Notes:

- 1. The quantities for civil engineering listed above is a site specific estimate, topographic is based on USGS 10-ft contours.
- 2. The quantities listed is based on General Arrangement WorleyParsons drawing CAES-1-DW-111-002-101, Rev. B
- 3. Cut and fill quantities are based on 3 levels, i.e.. Plant-El 995, switch yard-El 985 and laydown-El 980, the bottom of the stormwater pond is at El 970.
- 4. The Fence length is based on the entire site as shown in General Arrangement listed above.
- 5. The frost depth is 54", therefore, all mechanical pipes are considered have 5.5 ft cover.
- 6. The lengths and sizes of mechanical pipes are provided by mechanical department. And they are revised per latest revisions on 9/21/11.

Notes:						
1. The quant	ities for civi	l eng	gineering listed above is a site specific estimate, topographic is based	d on USGS	10-ft conto	ours.
			sed on General Arrangement WorleyParsons drawing CAES-1-DW-1		1. Rev. C	
Cut and fil	I quantities	are b	based on 3 levels, i.e Plant-El 995, switch yard-El 985 and laydown-	·El 980,		
the bottom	n of the stor	mwa	ater pond is at El 970.			
4. The Fence	e length is b	ased	d on the entire site as shown in General Arrangement listed above.			
5. The frost of	depth is 54"	, the	refore, all mechanical pipes are considered have 5.5 ft cover.			
6. The length	ns and sizes	of r	mechanical pipes are provided by mechanical department. And they	are revised	l per latest	revisions on 9/21/11.
